如何修改Jupyter Notebook的启动文件夹

如果你的电脑已经将Python及Anaconda的加到了环境变量里面,那么可以在Windows的文件浏览器的地址栏直接输入 jupyter notebook 。

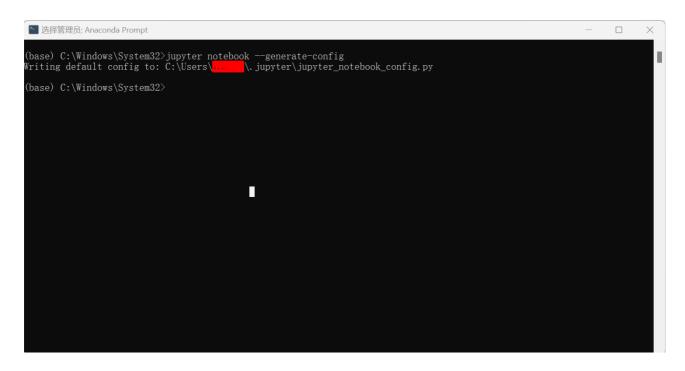

此外可以通过如下说明修改默认启动文件夹:

1. 首先进入cmd·如果Python环境变量已经设置成功可以直接在系统打开cmd。如果没有设置环境变量,可以从开始菜单anaconda下选择进入,如下图所示:

2. 在cmd下,输入 jupyter notebook --generate-config

请注意涂黑部分应该是你自己电脑的用户名

3. 打开对应路径下的对应文件(应该是C盘用户(user)-你的用户名 这个文件夹下 jupyter_notebook_config.py)·搜索 "c.NotebookApp.notebook_dir", 版本不同也可能是 "c.ServerApp.root_dir"·请注意画线部分上面的注释应该是 "The directory to use for notebooks and kernels."

```
957
                                                             > c.ServerApp.root_dir
                                                                                                 \uparrow \downarrow \equiv \times
    ## Preferred starting directory to use for notebooks
    # ServerApp.preferred dir is deprecated in jupyter-server 2.0. Use
960 # FileContentsManager.preferred dir instead
961 # Default: ''
    # c.ServerApp.preferred dir = ''
963
    ## DISABLED: use %pylab or %matplotlib in the notebook to enable matplotlib.
964
    # Default: 'disabled'
    # c.ServerApp.pylab = 'disabled'
966
967
968
    ## If True, display controls to shut down the Jupyter server, such as menu items
    # or buttons.
969
970
    # Default: True
971
    # c.ServerApp.quit_button = True
972
973
     ## DEPRECATED. Use ZMQChannelsWebsocketConnection.rate_limit_window
974
    # Default: 0.0
975
     # c.ServerApp.rate_limit_window = 0.0
976
977
     ## Reraise exceptions encountered loading server extensions?
978
     # Default: False
979
     # c.ServerApp reraise_server_extension failures = False
980
981
     ## The directory to use for notebooks and kernels.
982
     # Default: ''
      # c.ServerApp.root_dir = ''
983
984
```

4. 取消该行注释 (删掉最前方的#),在等号后面的引号中输入新的文件夹路径

```
## The directory to use for notebooks and kernels.

## Default: ''

ServerApp.root_dir = r'c:\newfolder'

981 ## The directory to use for notebooks and kernels.
```

5. 关闭所有应用, 重启电脑路径应该就修改好了
